# Ecosystem models for EFlows

Based on a combination of data, knowledge and experience, use scenarios to show how interventions in river basins resonate through to biodiversity, ecosystem services, and lives and livelihoods.

Interventions change the following drivers :

- Hydrology
- Hydraulics
- Sediments
- Water quality
- Barriers (connectivity)
- Harvesting pressure

# DRIFT Model

[www.drift-eflows.com](http://www.drift-eflows.com)

# Indicators to represent ecosystem and social use

A network of indicators is used to describe the river ecosystem and its human users. These include:

- a range of aspects of the flow, sediment and WQ regime of the river
- a range of ecosystem attributes
- a range of river-linked social attributes

Change described as a % change from baseline for each indicator

# Selection of driving indicators for one site

Discipline	DRIVING Indicators
Hydrology (sub-set)	Dry season onset
	Dry season min 5-day discharge
	Dry season duration
	Dry season average daily volume
	Wet season onset
	Wet season duration
	Wet season maximum discharge
	Wet season duration
	Wet season flood volume
	Within-day range in discharge
Hydraulics	Width/wetted perimeter
	Depth
	Mean velocity
	Mean shear stress
Suspended sediments	Dry: min/max/mean Coarse suspended sediment
	Dry: min/max/mean Fine suspended sediment
	Wet: min/max/mean Coarse suspended sediment
	Wet: min/max/mean Fine suspended sediment
Water quality	Nutrient concentrations
	Temperature

# Selection of responding indicators for one site

Discipline	RESPONDING Indicators
Geomorphology (habitat)	Lengths of cut banks
	Bed sediment size (fine to coarse)

Discipline	RESPONDING Indicators
Macroinvertebrates	Ephemeroptera
	Midges
	Pest species
	Shrimps/prawns
Fish (sub-set)	Hydrocynus vittatus
	Mormyrops anguilloides
	Labeo cylindricus
	Cichlids
	Distichodus spp
	Labeo altivelis

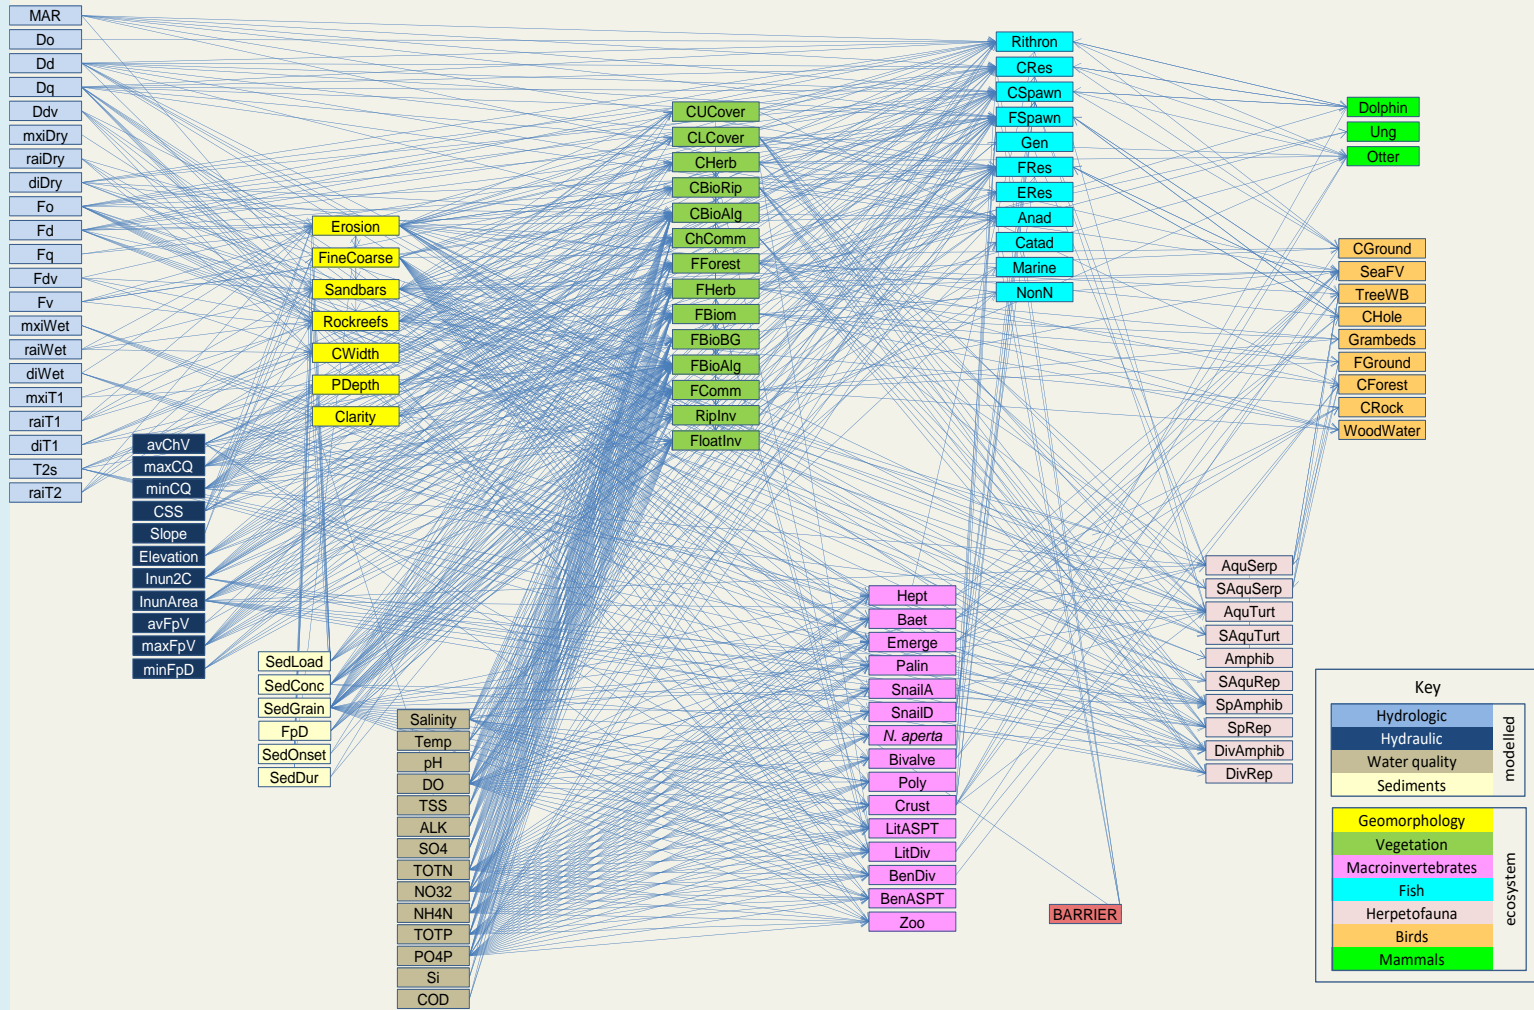

Discipline	RESPONDING Indicators
Crocodiles	Availability of fish
	Availability of fruits (figs, etc.)
Social	Extent of grazing for livestock
	Availability of reeds and grasses
	Extent of flood irrigated commercial agriculture

# Captures relationships of driving and responding indicators

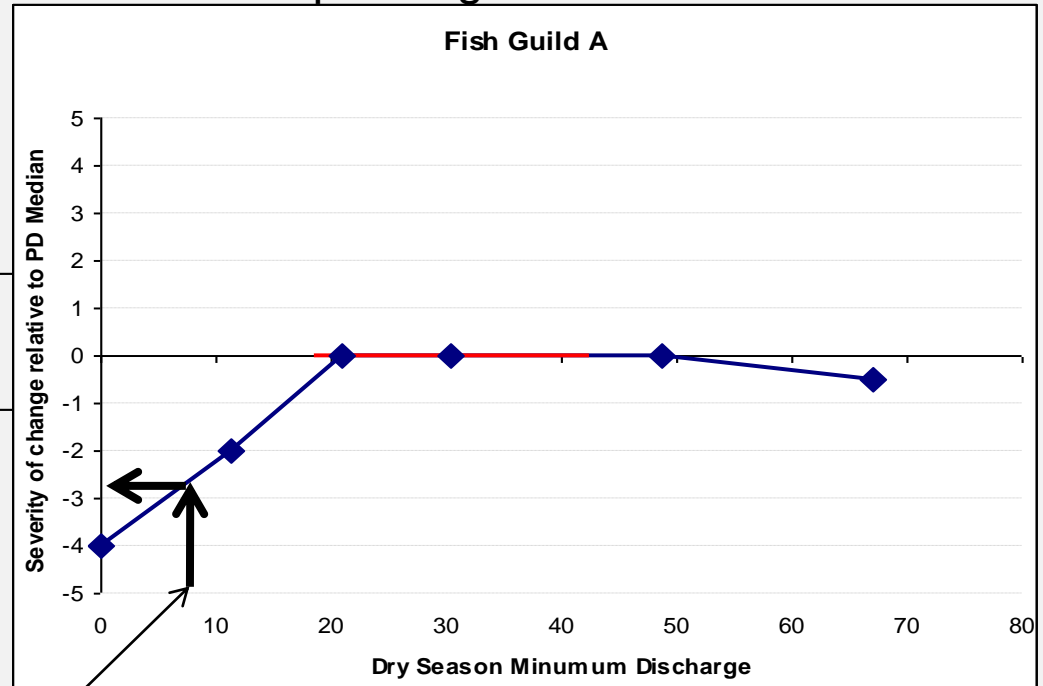

# A simplified eco-social model that is true to the complexity of river ecosystems and social uses

External modelled time series

Transformed into time series of driving indicators

Each responding indicator

Curves combined using multi-criteria decision analysis procedures

Scenario: Dry season minimum discharge for each year

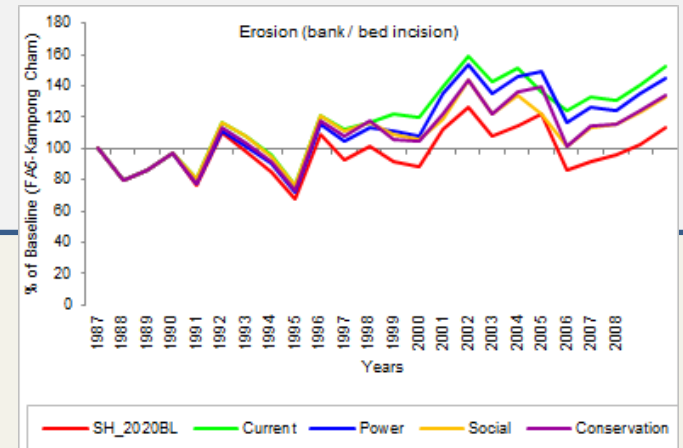

External modelled time series

Each responding indicator

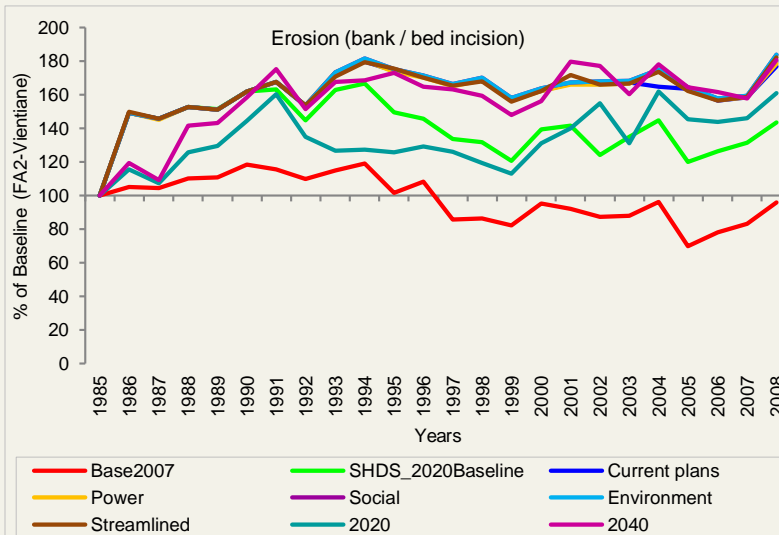

Transformed into time series of driving indicators

DRIFT prediction of change for each year  
*30 years of record = 30 values*

# Basic output is time series of relative change per indicator

80% increase in erosion

'Health' of overall Habitat

50% reduction in white fish

Health of fish community

A	Natural
B	Moderately modified
C	
D	Considerably modified
E	

- Basin-scale, time-series based
- Capture the functioning of river ecosystems
- Assess multi-dimensional scenarios
  - flow of water
  - sediments
  - water quality
  - management issues (channelisation/over-harvesting/sand mining)
- Provide reasons for predictions
- Build capacity and understanding
- Use available information
- Asset for ongoing management, teaching ...
- Updated/expanded over time
- Tried and tested

# EXAMPLE OF APPLICATIONS

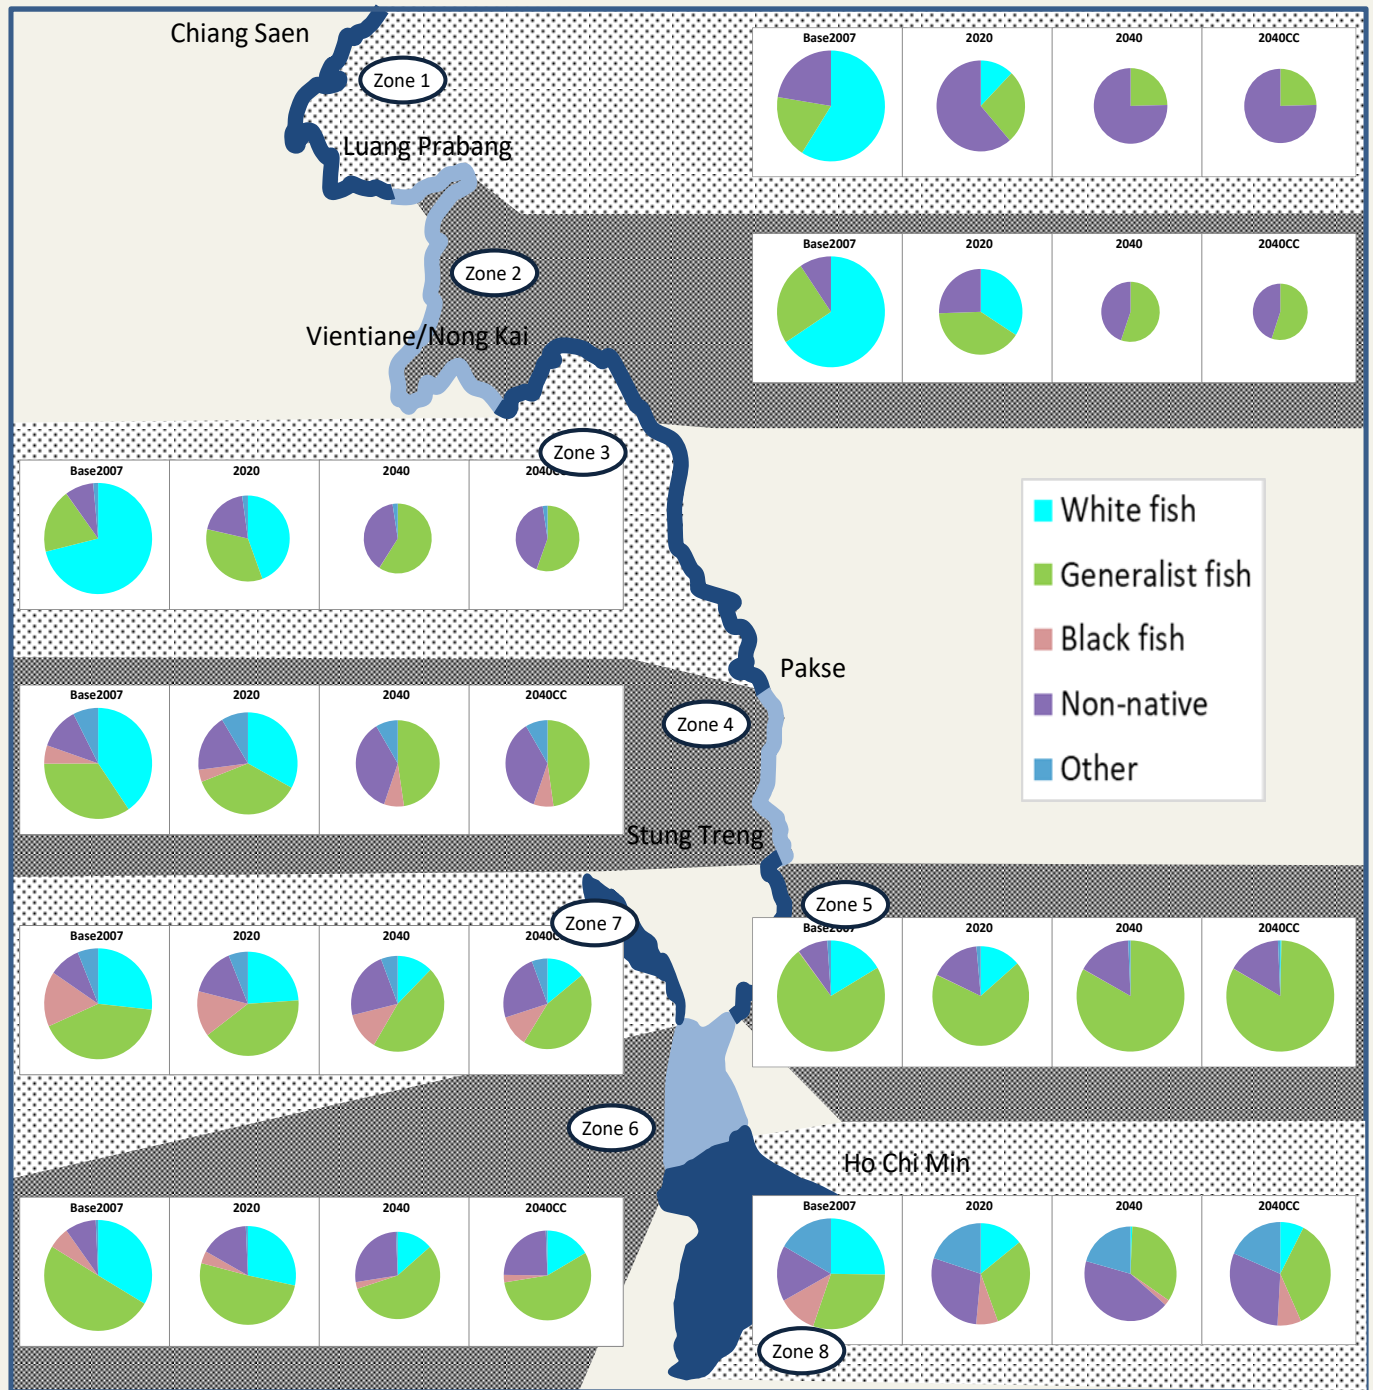

# Predict impacts of development (or restoration) on ecosystem condition

A	Natural
A/B	
B	
B/C	Moderately modified
C	
C/D	
D	Completely modified
D/E	
E	
	Reservoir

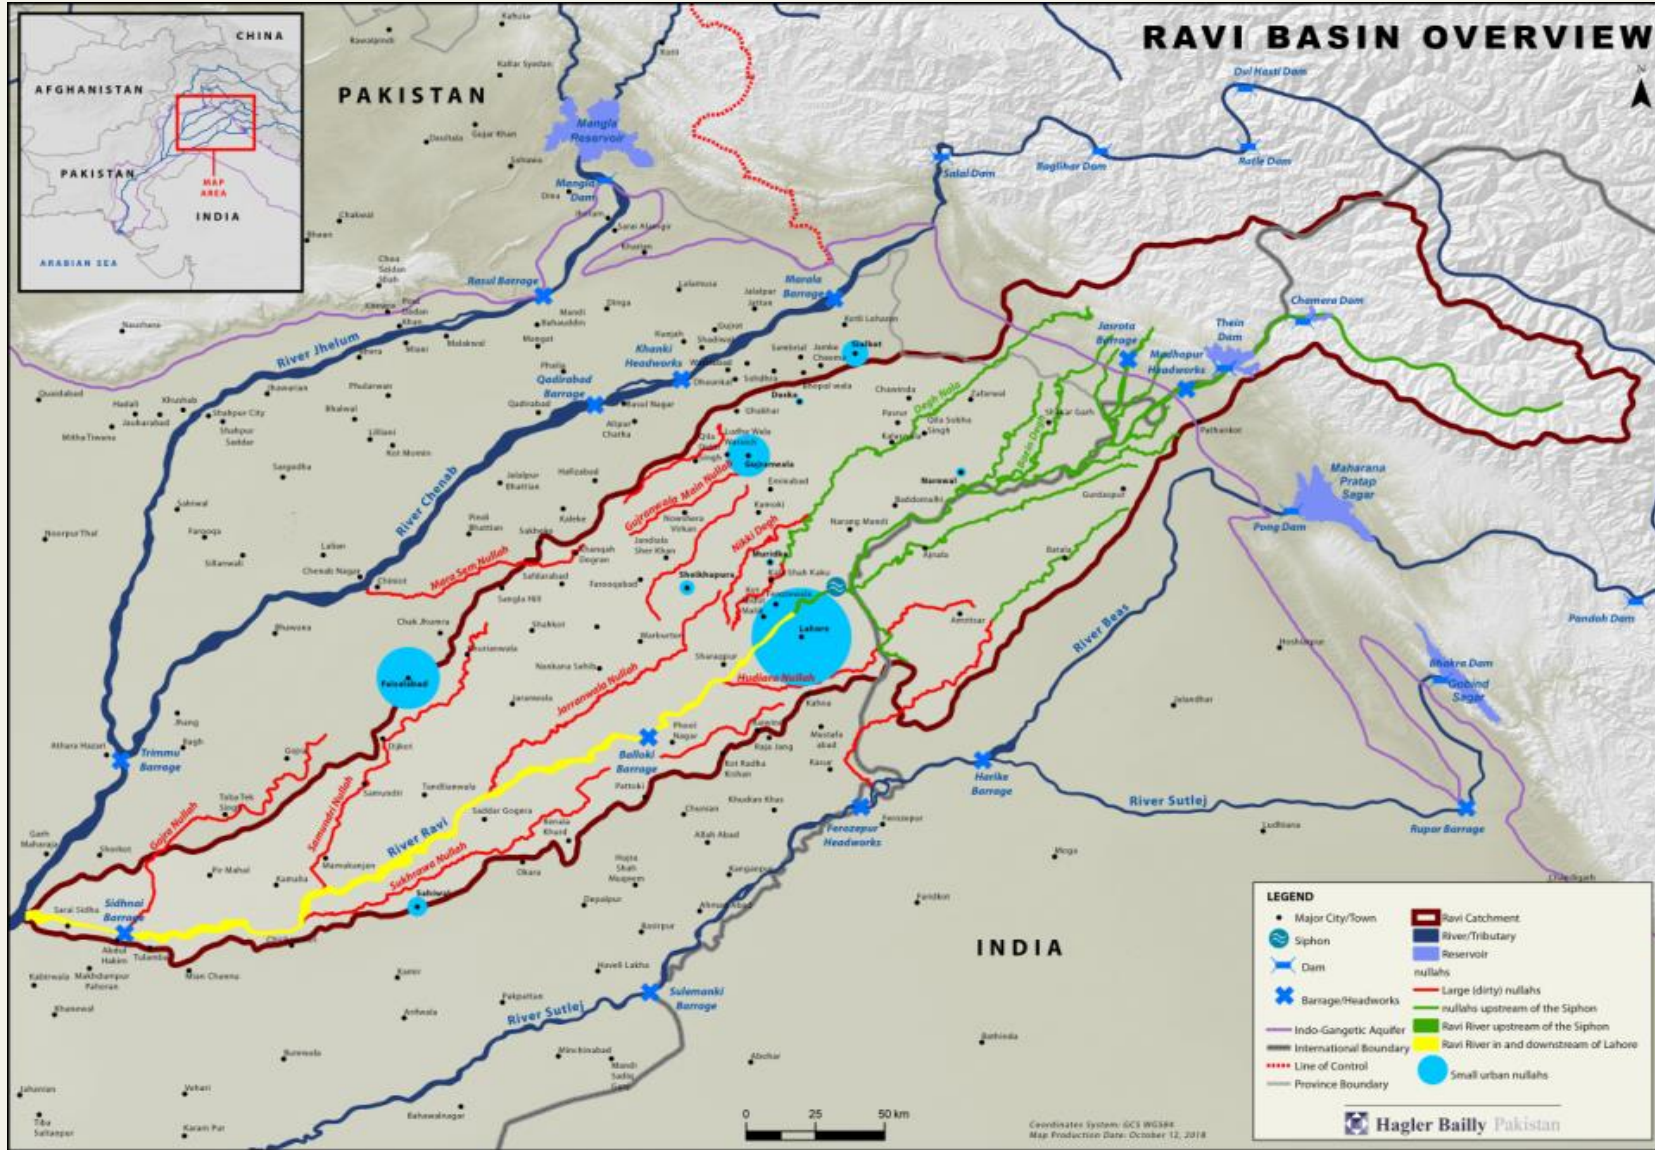

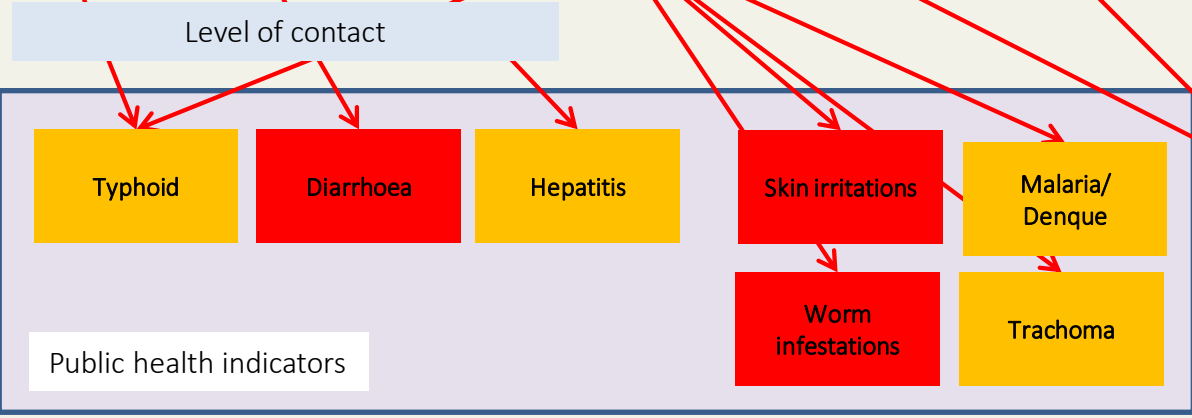

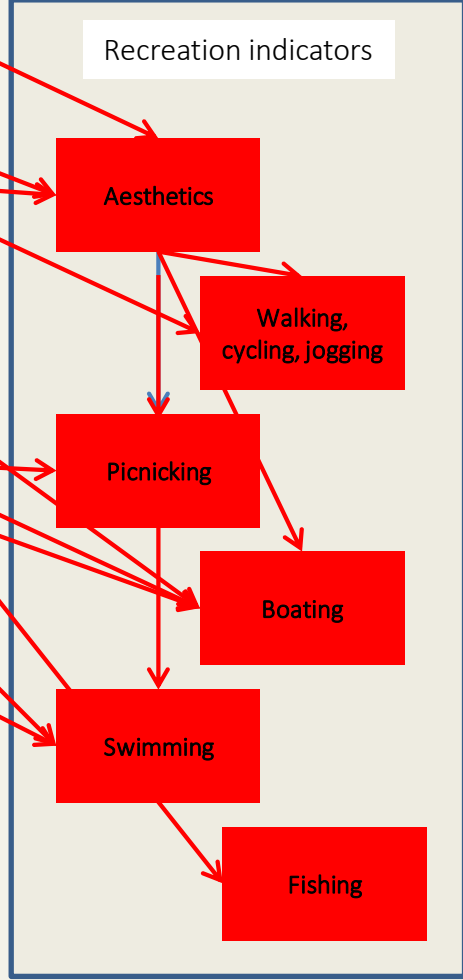

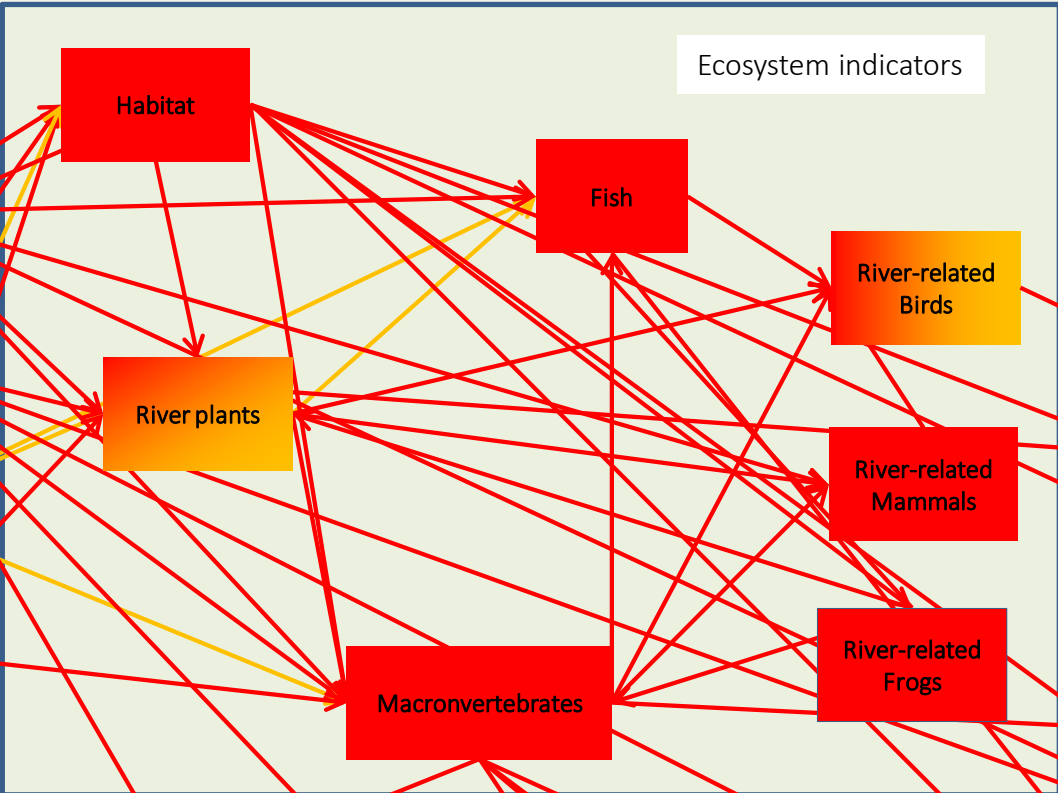

... and on individual resources

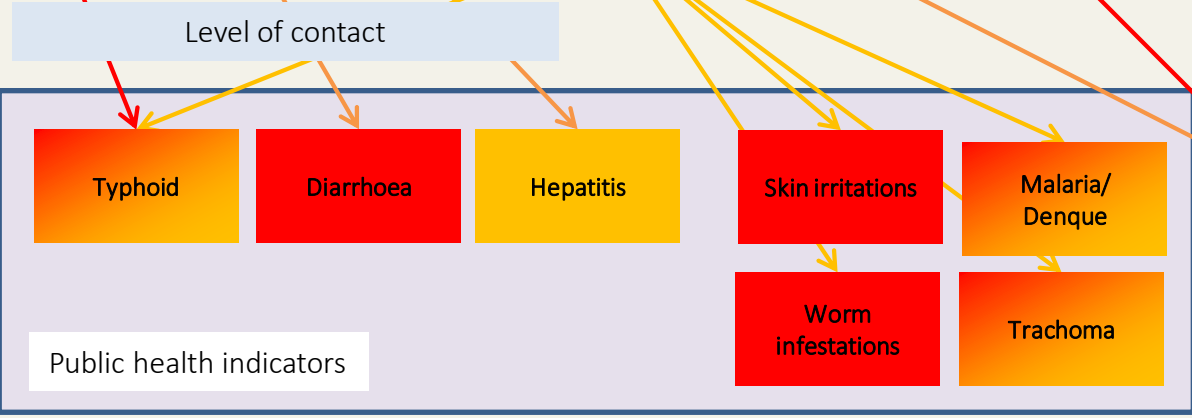

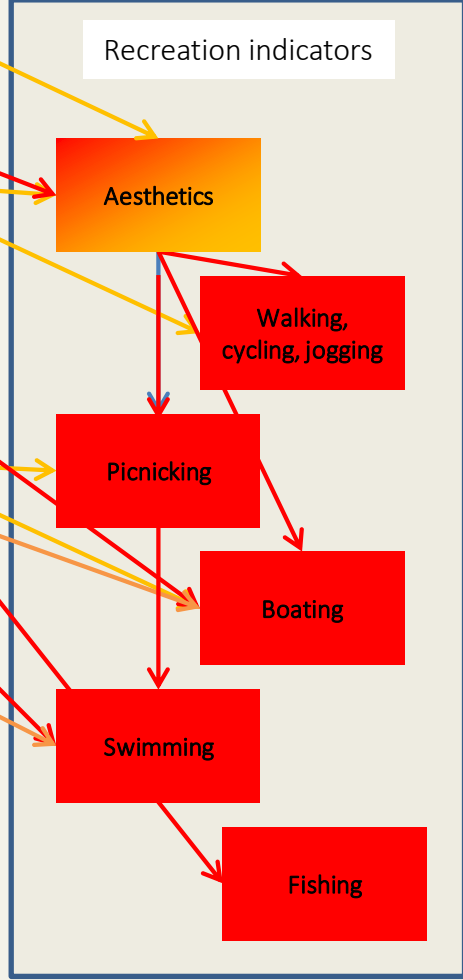

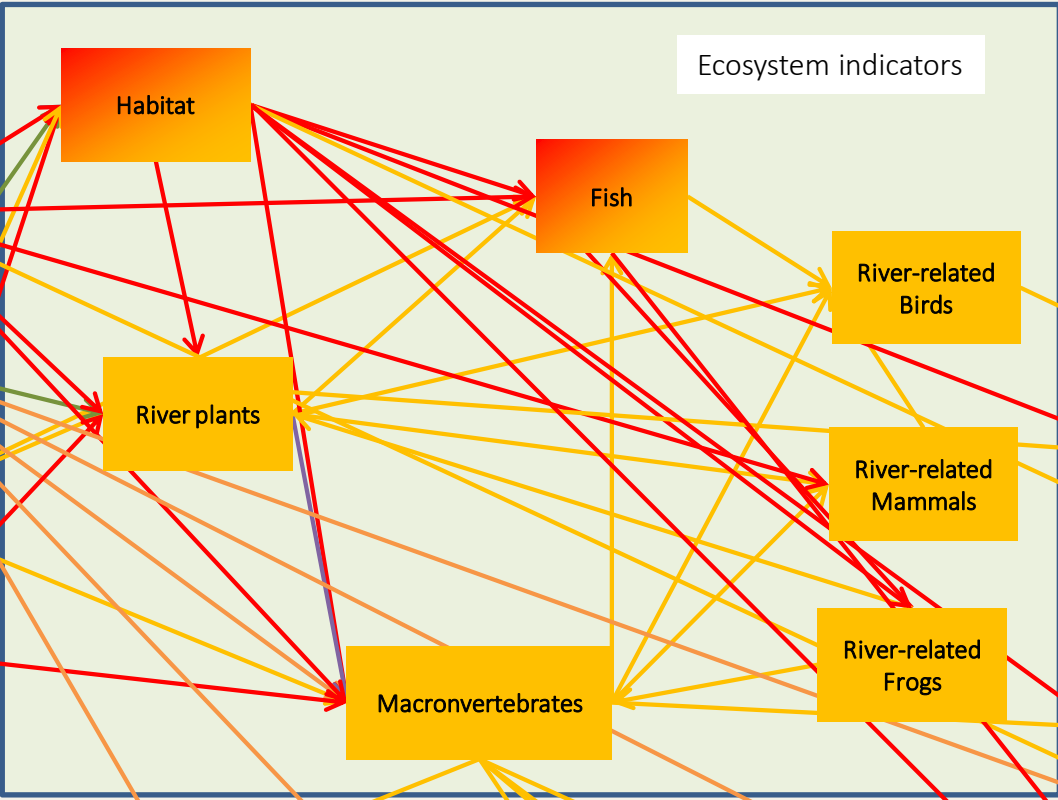

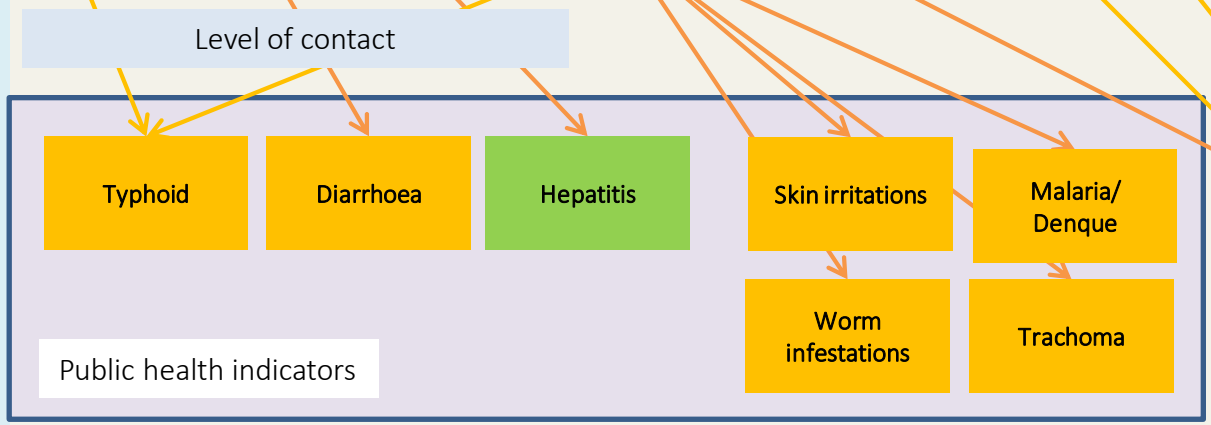

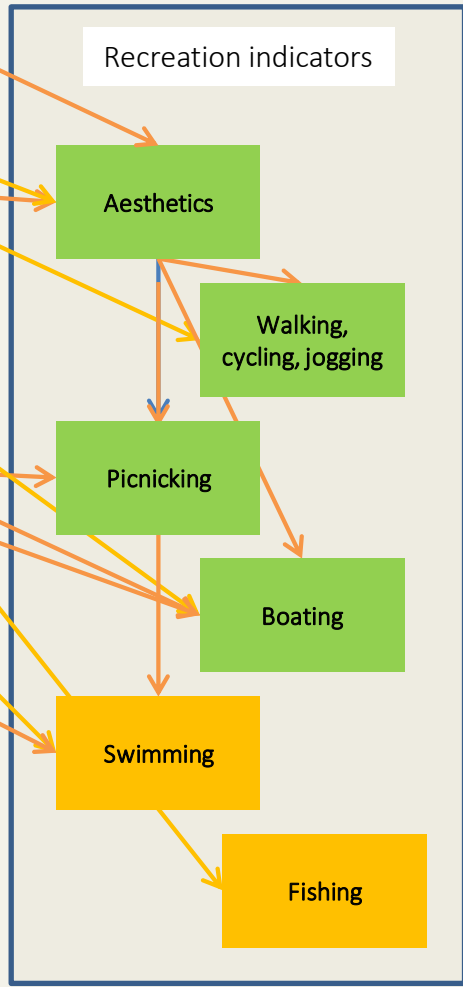

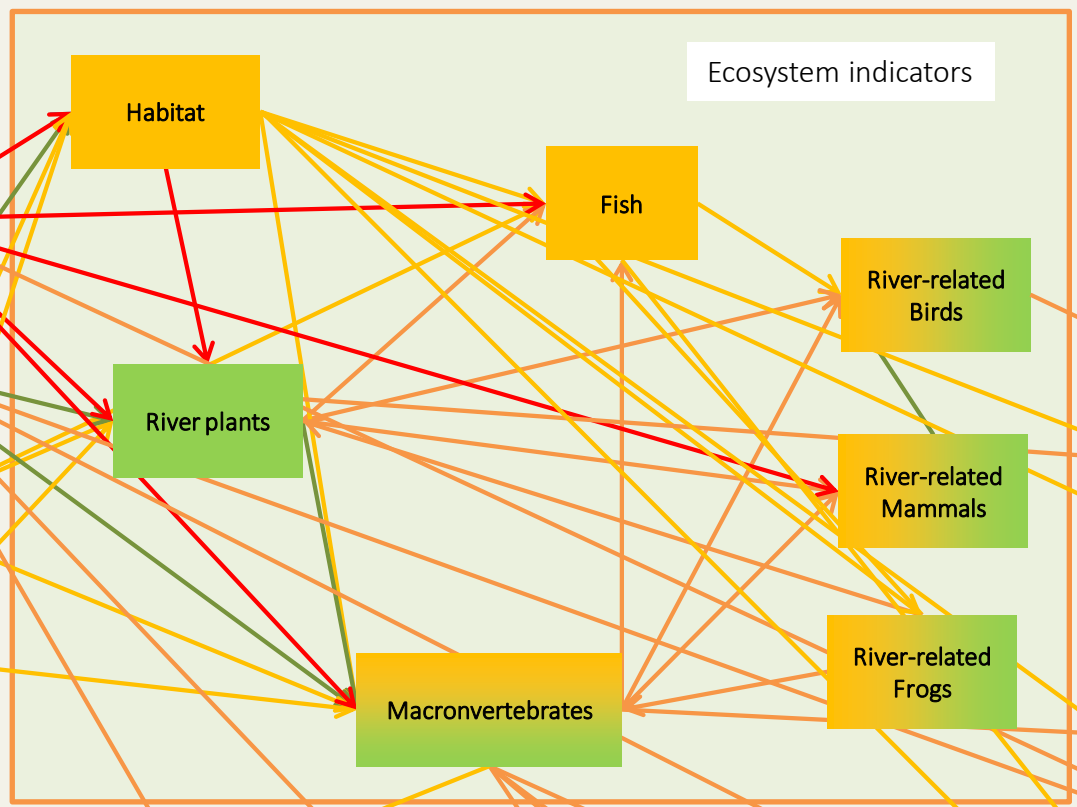

# Ravi Basin, Punjab, Pakistan

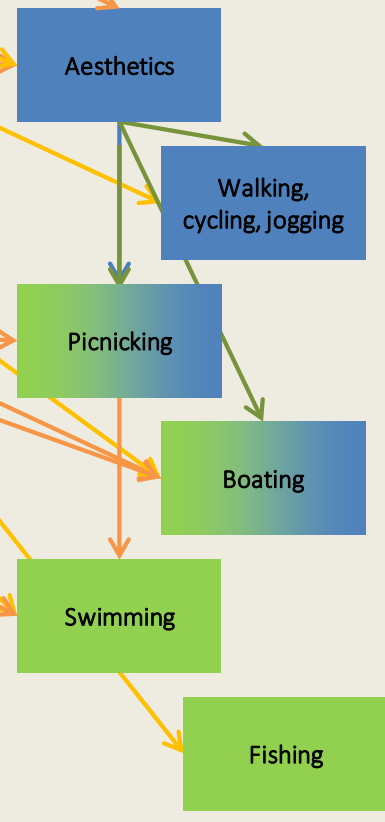

Driving indicators

- Hydrology
- Water quality
- Sediment
- Other interventions

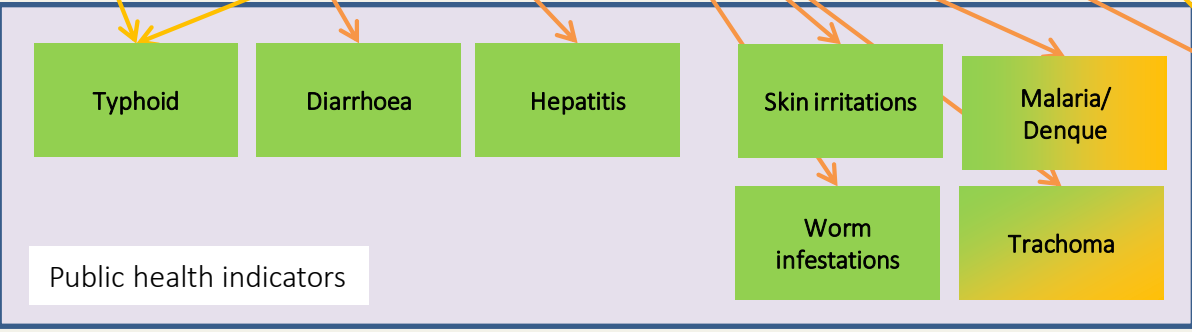

Ecosystem indicators

Recreation indicators

Level of contact

# Some other applications

- Zambezi Basin
- Pangani Basin
- Breede Basin
- Kafue Flats and Lower River
- Elephant Marsh on Shire
- Lilongwe Basin
